CS 4395 Text Processing with Python

This program takes in a scattered data file containing employee information, and cleans it up, pickles, and outputs. It is run through `sys.args`, added along with the file name in terminal. A few weaknesses of text processing in python includes the difficulty to use it, along with issues with splits done only through sentences. A few advantages of text processing in python include the vast support it provides and credibility. This assignment was a good review of basics in Python. The challenge I faced was getting the file opening to work for OS variability. The pickling of a file was new topic that I learned a bit more about in this topic.
